Packaging light weight parts into bags

Our customer's application required packaging small quantities of light weight parts into bags at speeds up to 24 bpm. They also required the ability to blend 4 separate parts at rates up to 6 bpm. Weigh Right designed our PMB-4 Scale with isolated load cells off the main frame to avoid cross vibration and provide accurate counts for these light weight pieces. The supply hopper was designed with 4 separate compartments to load 4 different parts when blending. [Take a look at this video to see it in action.](#)

Shown Above: PMB-4 Scale with isolated load cell columns.
