Packaging Plastic Parts into Cartons

For customers packaging product into cartons, Weigh Right offers a complete system including our iQ-1E entry-level scale with a 3-tray vibratory feed design, that utilizes Weigh / Count technology to portion the product quickly and accurately using the average piece weight and dispensing it automatically into the carton. The product is elevated to the iQ-1E's hopper by our IC-45 infeed conveyor that is loaded at floor level and controlled by a level sensor to turn on-and-off. The cartons are automatically indexed by our HC-10 container indexing conveyor that offers a diving spout to ensure a clean transfer and underbelt vibration to settle the contents into the carton. Check out our new video of this complete automated system.
